

# OPTIMIZING IT WITH KONSULTANCY

## Active Directory Audit

An **optimized** Microsoft Active Directory implementation will **lower your cost** of administration.

Over time, **changes made** to the Active Directory can cause it to **become compromised** and **unmanageable** which in turn increases the cost of supporting it.

An Active Directory design is often missing the **appropriate security and optimization** that an organization needs to **maximise the investment** made in Microsoft technologies.

Reduced costs are achieved by having administrative **privileges appropriately delegated**, across an **optimally designed** Organizational Unit structure, allowing a **granular set of policies** to apply throughout the corporate IT estate.

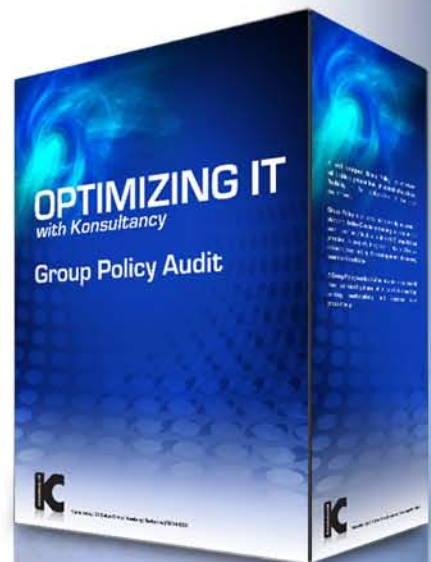

An **Active Directory Audit** will **quickly highlight** the **actions required** to move toward an **optimized estate**.

## Group Policy Audit

A well designed **Group Policy** implementation will enable a **greater level of control** while allowing **flexibility** in the configuration of the user environment.

**Group Policy** is an area **not normally covered** in standard **Active Directory** training courses and as such it can be difficult to implement **Microsoft best practice** to properly integrate it into a Windows infrastructure helping the **management of servers, users and desktops**.

A **Group Policy Audit** will show how users can **benefit** from **optimized policies** which can help **speed up** existing **workstations** and **increase user productivity**.

## Windows Deployment Optimization

**Efficient deployment** of desktops and servers **reduces** the **ongoing maintenance** required **lowering** the **Total Cost of Ownership** for the entire infrastructure.

It is common to find **multiple build images** for the **same operating system**, each with slight **variances** to the next. When **changes** are required, **every image** must be **updated** for **consistency**. The **fewer** the number of **images** to maintain, the **lower** the **cost** involved in managing them.

**Windows Deployment Optimization** provides organisations with an insight into the current **best practice** approach of **deployment** and **ongoing management** of operating system images.
